High-Scale Data Segmentation

CASE STUDY B

Hello and welcome. In this project, I will share my experience segmenting a database that would directly support call center operations.

The Challenge

Marriott’s database contained hundreds of thousands of records. The challenge was for marketing to pull their own custom, high-accuracy segments of owners most likely to book to increase conversion.

The Strategy

I acted as an independent technical lead by writing SQL queries and creating final send list data extensions. I worked with the sales team to define an "Ideal Owner Profile" and created a process to keep these lists refreshed quarterly. Key tools:

- *Salesfoce Marketing Cloud*
- *Microsoft 365*

```sql
SELECT firstname, email, FROM Owners_SFDE
WHERE email IS NOT NULL AND email != ''
AND ownerType = 'primary' AND canNotEmail = 'false'
AND canNotCall = 'false' AND canNotMail = 'false' AND canNotSMS = 'false'
AND distanceFromClosestResort <= 100 AND
productType = 'vacation ownership' AND country = 'United States'
AND state IN ('FL', 'CA', 'NY', 'NV', 'HI')
ANDlastTourDate >= '2025-01-01' AND lastTourDate <= '2025-12-31'
AND lastReservationDate >= '2025-01-01'
AND lastReservationDate <= '2025-12-31';
```

THE TECHNICAL EXECUTION

- Wrote complex queries in **Automation Studio** using WHERE and AND clauses to filter and refine data.
- Successfully filtered and managed segments of 100k+ records quarterly, ensuring 100% data accuracy.
- Aligned email deployment with call center outreach schedules, ensuring owners received an email before a sales representative called.

NOTE: This is a snippet of code that would query the data using SQL. This query pulls a targeted list of **active, contactable US owners** living in five specific states. A "clean" marketing list for people who are fully reachable across all channels. Final send list is not included.

```sql
SELECT firstname, email, FROM Owners_SFDE
WHERE email IS NOT NULL AND email != ''
AND ownerType = 'primary' AND canNotEmail = 'false'
AND canNotCall = 'false' AND canNotMail = 'false' AND canNotSMS = 'false'
AND distanceFromClosestResort <= 100 AND
productType = 'vacation ownership' AND country = 'United States'
AND state IN ('FL', 'CA', 'NY', 'NV', 'HI')
ANDlastTourDate >= '2025-01-01' AND lastTourDate <= '2025-12-31'
AND lastReservationDate >= '2025-01-01'
AND lastReservationDate <= '2025-12-31';
```

Sample Result Preview:

firstname	email
***	***
***	***
***	***

THE RESULT

By taking ownership of the SQL process, this precise targeting led to a **measurable lift in sales win rates** and a significant reduction in unsubscribes, as members only received offers relevant to their specific ownership phase.

NOTE: The query pulls primary owners who live within driving distance of a resort. The sample table is for illustration.

THE CLOSING

After having clearly defined criteria, I used my knowledge of **SQL** to achieve a measurable lift in sales win rates and a significant reduction in unsubscribes. Using **Microsoft 365** I was able to communicate with the Sales and Marketing team and define and save a new process.
